

### Exercise 6.1

**Q1.** In Fig. 6.13, lines AB and CD intersect at O. If  $\angle AOC + \angle BOE = 70^\circ$  and  $\angle BOD = 40^\circ$ , find  $\angle BOE$  and reflex  $\angle COE$ .

**Solution:**

Let  $\angle AOC = x$  and  $\angle BOE = y$ .

Then  $x + y = 70^\circ$  ( $\angle AOC + \angle BOE = 70^\circ$ )

Let Reflex  $\angle COE = z$

We can see that AB and CD are two intersecting lines, so the pair of angles formed are vertically opposite angles and they are equal.

i.e,  $\angle AOD = \angle BOC$  and  $\angle AOC = \angle BOD$ .

Since  $\angle AOC = x$  and  $\angle AOC = \angle BOD = 40^\circ$

Thus, we can say that  $x = 40^\circ$ .

Also we know that,

$$x + y = 70^\circ$$

$$40^\circ + y = 70^\circ$$

$$y = 70^\circ - 40^\circ = 30^\circ$$

$$\angle BOE = 30^\circ$$

If we consider line AB and ray OD on it, then  $\angle AOD$  and  $\angle BOD$  are adjacent angles.

$$\angle AOD + \angle BOD = 180^\circ$$

$$\angle AOD + 40^\circ = 180^\circ$$

$$\angle AOD = 180^\circ - 40^\circ$$

$$= 140^\circ$$

$$\text{Reflex } \angle COE = \angle AOC + \angle AOD + \angle BOD + \angle BOE$$

$$= 40^\circ + 140^\circ + 40^\circ + 30^\circ$$

$$= 250^\circ$$

Thus,  $\angle BOE = 30^\circ$  and the reflex  $\angle COE = 250^\circ$ .

2. In Fig. 6.14, lines XY and MN intersect at O. If  $\angle POY = 90^\circ$  and  $a : b = 2 : 3$ , find c.

**Solution:**

Given:  $\angle POY = 90^\circ$  and  $a : b = 2 : 3$ .

If two lines intersect with each other, then the vertically opposite angles formed are equal.

Line OP is perpendicular to line XY. Hence  $\angle POY = \angle POX = 90^\circ$

$$\angle POX = \angle POM + \angle MOX$$

$$90^\circ = a + b \dots(1)$$

Since a and b are in the ratio 2 : 3 that is,

$$a = 2x \text{ and } b = 3x \dots(2)$$

Substituting (2) in (1),

$$a + b = 90^\circ$$

$$2x + 3x = 90^\circ$$

$$5x = 90^\circ$$

$$x = 90^\circ/5 = 18^\circ$$

$$a = 2x = 2 \times 18^\circ$$

$$a = 36^\circ$$

$$b = 3x = 3 \times 18^\circ$$

$$b = 54^\circ$$

$$\text{Also, } \angle \text{MOY} = \angle \text{MOP} + \angle \text{POY}$$

$$= a + 90^\circ$$

$$= 36^\circ + 90^\circ = 126^\circ$$

Lines MN and XY intersect at point O and the vertically opposite angles formed are equal.

$$\angle \text{XON} = \angle \text{MOY}$$

$$c = 126^\circ$$

3. In Fig. 6.15,  $\angle \text{PQR} = \angle \text{PRQ}$ , then prove that  $\angle \text{PQS} = \angle \text{PRT}$ .

**Solution:**

Given:  $\angle \text{PQR} = \angle \text{PRQ}$

To prove:  $\angle \text{PQS} = \angle \text{PRT}$

We know that, if a ray stands on a line, then the sum of adjacent angles formed is  $180^\circ$ .

Let  $\angle \text{PQR} = \angle \text{PRQ} = a$ .

Let  $\angle PQS = b$  and  $\angle PRT = c$ .

Lines ST and PQ intersect at point Q, hence the sum of adjacent angles  $\angle PQS$  and  $\angle PQR$  is  $180^\circ$ .

$$\angle PQS + \angle PQR = 180^\circ$$

$$b + a = 180^\circ$$

$$b = 180^\circ - a \dots (1)$$

Lines ST and PR intersect at point R, hence the sum of adjacent angles  $\angle PRQ$  and  $\angle PRT$  is  $180^\circ$ .

$$\angle PRQ + \angle PRT = 180^\circ$$

$$a + c = 180^\circ$$

$$c = 180^\circ - a \dots (2)$$

From equations (1) and (2), it is clear that  $b = c$ . Hence  $\angle PQS = \angle PRT$  is proved.

**4. In Fig. 6.16, if  $x + y = w + z$ , then prove that AOB is a line.**

**Solution:**

Given:  $x + y = w + z$

To prove: AOB is a line.

We know that if the sum of two adjacent angles is  $180^\circ$ , then the non-common arms of the angles form a line.

From the figure we can see that,

$$(x + y) + (w + z) = 360^\circ \text{ (complete angle)}$$

It is given that  $(x + y) = (w + z)$ ,

Hence  $(x + y) + (w + z) = 360^\circ$  can be written as  $(x + y) + (x + y) = 360^\circ$

$$2x + 2y = 360^\circ$$

$$2(x + y) = 360^\circ$$

$$x + y = 360^\circ/2 = 180^\circ$$

Since the sum of adjacent angles,  $x$  and  $y$  with  $OA$  and  $OB$  as the non-common arms is  $180^\circ$  we can say that  $AOB$  is a line.

**5. In Fig. 6.17,  $POQ$  is a line. Ray  $OR$  is perpendicular to line  $PQ$ .  $OS$  is another ray lying between rays  $OP$  and  $OR$ . Prove that  $\angle ROS = \frac{1}{2}(\angle QOS - \angle POS)$ .**

**Solution:**

Given:  $OR$  is perpendicular to  $PQ$ .  $\angle ROQ = \angle ROP = 90^\circ$ .

To prove:  $\angle ROS = \frac{1}{2}(\angle QOS - \angle POS)$ .

When a ray intersects a line, the sum of adjacent angles so formed is  $180^\circ$ .

Let  $\angle ROS = a$ ,  $\angle POS = b$  and  $\angle SOQ = c$ .

To prove that:  $a = \frac{1}{2}(c - b)$ .

Since  $\angle ROQ = \angle ROP = 90^\circ$ ,

We can say,  $\angle POS + \angle SOR = \angle POR$

$$b + a = 90^\circ \dots (1)$$

Line  $PQ$  is intersected by ray  $OS$ .

Hence  $\angle POS + \angle SOQ = b + c = 180^\circ$

$$b + c = 180^\circ \dots (2)$$

From equation (1), we get  $a + b = 90^\circ$

Multiplying by 2 on both sides we get,

$$2(a + b) = 2 \times 90^\circ$$

$$2(a + b) = 180^\circ \dots (3)$$

Comparing equations (3) and (2),

$$2(a + b) = b + c$$

$$2a + 2b = b + c$$

$$2a = b + c - 2b$$

$$2a = c - b$$

$$a = \frac{1}{2}(c - b)$$

$$\therefore \angle ROS = \frac{1}{2}(\angle QOS - \angle POS)$$

**6. It is given that  $\angle XYZ = 64^\circ$  and XY is produced to point P. Draw a figure from the given information. If ray YQ bisects  $\angle ZYP$ , find  $\angle XYQ$  and reflex  $\angle QYP$ .**

**Solution:**

Given:  $\angle XYZ = 64^\circ$  and Ray YQ bisects  $\angle ZYP$ .

To Find:  $\angle XYQ$  and Reflex  $\angle QYP$

When a ray intersects a line, the sum of adjacent angles formed is  $180^\circ$ .

With the given information in the question, we can come up with this diagram.

Ray YQ bisects  $\angle ZYP$ .

Let,  $\angle ZYQ = \angle QYP = a$ .

We can see from the figure that PX is a line and YZ is a ray intersecting at point Y and the sum of adjacent angles so formed is  $180^\circ$ .

$$\text{Hence } \angle ZYP + \angle ZYX = 180^\circ$$

$$\angle ZYQ + \angle QYP + \angle ZYX = 180^\circ \text{ [Since, } \angle ZYP = \angle ZYQ + \angle QYP\text{]}$$

$$a + a + 64^\circ = 180^\circ$$

$$2a + 64^\circ = 180^\circ$$

$$2a = 180^\circ - 64^\circ = 116^\circ$$

$$a = 116^\circ / 2 = 58^\circ$$

$$\therefore \text{Then } \angle XYQ = \angle XYZ + \angle ZYQ$$

$$\angle XYQ = a + 64^\circ$$

$$\Rightarrow \angle XYQ = 58^\circ + 64^\circ = 122^\circ.$$

$$\angle XYQ = 122^\circ$$

$$\text{As } \angle QYP = a,$$

$$\text{Thus, Reflex } \angle QYP = 360^\circ - a$$

$$\Rightarrow 360^\circ - 58^\circ = 302^\circ$$

$$\text{Reflex } \angle QYP = 302^\circ.$$

Thus, we have  $\angle XYQ = 122^\circ$  and Reflex  $\angle QYP = 302^\circ$ .

### Exercise 6.2

**Q1.** In Fig. 6.28, find the values of  $x$  and  $y$  and then show that  $AB \parallel CD$ .

### Solution:

When two lines intersect, vertically opposite angles are formed at the point of intersection which is equal.

Also, when a ray intersects a line, the sum of adjacent angles formed is  $180^\circ$  as it forms a linear pair.

If a transversal intersects two lines such that a pair of alternate interior angles are equal, then the two lines are parallel to each other.

Line CD is intersecting with line P. Hence the vertically opposite angles so formed are equal.

Thus,  $y = 130^\circ$ .

Similarly, line AB intersects with line P forming a linear pair. Hence the sum of adjacent angles formed is  $180^\circ$ .

$$x + 50^\circ = 180^\circ$$

$$x = 180^\circ - 50^\circ$$

$$x = 130^\circ$$

We know that, if a transversal intersects two lines such that a pair of alternate interior angles are equal, then the two lines are parallel.

Here we can see that the pair of alternate angles formed when lines AB and CD are intersected by transversal P are equal.

i.e,  $x = y = 130^\circ$ . So we can say the two lines AB and CD are parallel.

Hence  $AB \parallel CD$  is proved.

2. In Fig. 6.29, if  $AB \parallel CD$ ,  $CD \parallel EF$  and  $y : z = 3 : 7$ , find x.

### Solution:

Given:  $AB \parallel CD$ ,  $CD \parallel EF$  and  $y : z = 3 : 7$

To find: The value of  $x$

When two parallel lines are cut by a transversal, co-interior angles formed are supplementary.

Also, we know that lines which are parallel to the same line are parallel to each other.

Thus, If  $AB \parallel CD$ ,  $CD \parallel EF$ , we can say  $AB \parallel EF$ .

Therefore, the angles  $x$  and  $z$  are alternate interior angles and hence are equal.

$$x = z \dots\dots(1)$$

$AB$  and  $CD$  are parallel lines cut by a transversal. So the co-interior angles formed are supplementary.

$$x + y = 180^\circ.$$

Since  $x = z$ ,

$$\text{We get } y + z = 180^\circ \dots\dots\dots (2)$$

Let,  $y = 3a$ ,  $z = 7a$  [Since,  $y : z = 3 : 7$ ]

Substituting the values in equation (2),

$$3a + 7a = 180^\circ$$

$$10a = 180^\circ$$

$$a = 180^\circ/10$$

$$a = 18^\circ$$

$$\therefore y = 3a = 3 \times 18 = 54^\circ$$

$$y = 54^\circ$$

$$\therefore x + y = 180^\circ$$

$$x + 54^\circ = 180^\circ$$

$$x = 180^\circ - 54^\circ$$

$$x = 126^\circ$$

Thus,  $x = 126^\circ$

**Q3. In Fig. 6.30, if  $AB \parallel CD$ ,  $EF \perp CD$  and  $\angle GED = 126^\circ$ , find  $\angle AGE$ ,  $\angle GEF$  and  $\angle FGE$ .**

**Solution:**

Given:  $AB \parallel CD$ ,  $EF \perp CD$  and  $\angle GED = 126^\circ$

To Find:  $\angle AGE$ ,  $\angle GEF$  and  $\angle FGE$

When two lines intersect, the sum of adjacent angles is supplementary.

When two parallel lines are cut by a transversal, alternate interior angles formed are equal.

Let  $\angle AGE = x$ ,  $\angle GEF = y$  and  $\angle FGE = z$ .

From the figure, we can see that,

$$\angle GED = \angle GEF + \angle FED$$

$$\angle GEF = \angle GED - \angle FED$$

$$y = 126^\circ - 90^\circ \text{ [ Since, } \angle GED = 126^\circ \text{ and } \angle FED = 90^\circ \text{ ]}$$

$$y = 36^\circ$$

Thus,  $\angle GEF = y = 36^\circ$

$AB$  and  $CD$  are parallel lines cut by a transversal, thus the pair of alternate interior angles formed are equal.

$$\angle AGE = \angle GED$$

Thus,  $\angle AGE = x = 126^\circ$

Line  $AB$  is intersected by line  $GE$  where  $x$  and  $z$  forms a linear pair.

$$x + z = 180^\circ$$

$$126^\circ + z = 180^\circ$$

$$z = 180^\circ - 126^\circ = 54^\circ$$

Thus,  $\angle FGE = z = 54^\circ$

**Q4. In Fig. 6.31, if  $PQ \parallel ST$ ,  $\angle PQR = 110^\circ$  and  $\angle RST = 130^\circ$ , find  $\angle QRS$ .**

**[Hint: Draw a line parallel to  $ST$  through point  $R$ .]**

**Answer:**

Given:  $PQ \parallel ST$ ,  $\angle PQR = 110^\circ$  and  $\angle RST = 130^\circ$

To Find:  $\angle QRS$

Lines which are parallel to the same line are parallel to each other.

When two parallel lines are cut by a transversal, co-interior angles formed are supplementary.

Construction: Draw a line  $AB$  parallel to  $ST$  through point  $R$ . Since  $AB \parallel ST$  and we know that  $PQ \parallel ST$ . Thus,  $AB \parallel PQ$ .

Let  $\angle SRQ = x$ ,  $\angle SRB = y$  and  $\angle QRA = z$

Lines  $ST$  and  $AB$  are parallel with transversal  $SR$  intersecting them. Therefore, the co-interior angles formed are supplementary.

$$\angle RST + \angle SRB = 180^\circ$$

$$130^\circ + y = 180^\circ$$

$$y = 180^\circ - 130^\circ = 50^\circ$$

Thus,  $\angle SRB = y = 50^\circ$

Similarly, lines  $PQ$  and  $AB$  are parallel with transversal  $QR$  intersecting the two lines. Therefore, the co-interior angles are supplementary.

$$\angle PQR + \angle QRA = 180^\circ$$

$$110^\circ + z = 180^\circ$$

$$z = 180^\circ - 110^\circ = 70^\circ$$

Thus,  $\angle QRA = z = 70^\circ$

AB is a line, RQ and RS are rays on AB. Hence,

$$\angle QRA + \angle QRS + \angle SRB = 180^\circ$$

$$70^\circ + x + 50^\circ = 180^\circ$$

$$120^\circ + x = 180^\circ$$

$$x = 180^\circ - 120^\circ = 60^\circ$$

Thus,  $\angle QRS = x = 60^\circ$ .

**Q5. In Fig. 6.32, if  $AB \parallel CD$ ,  $\angle APQ = 50^\circ$  and  $\angle PRD = 127^\circ$ , find  $x$  and  $y$ .**

**Answer:**

Given:  $AB \parallel CD$ ,  $\angle APQ = 50^\circ$  and  $\angle PRD = 127^\circ$

To Find:  $x$  and  $y$

When a ray intersects a line, the sum of adjacent angles formed is  $180^\circ$ .

When two parallel lines are cut by a transversal, alternate interior angles formed are equal.

AB and CD are parallel lines cut by transversal PQ hence the alternate interior angles formed are equal.

$$\angle APQ = \angle PQR \text{ and hence } x = 50^\circ.$$

Similarly, AB and CD are parallel lines cut by transversal PR hence the alternate angles formed are equal.

$$\angle APR = \angle PRD = 127^\circ$$

$$\angle APQ + \angle QPR = \angle PRD = 127^\circ$$

$$50^\circ + y = 127^\circ$$

$$y = 127^\circ - 50^\circ$$

$$y = 77^\circ$$

**Q6.** In Fig. 6.33, PQ and RS are two mirrors placed parallel to each other. An incident ray AB strikes the mirror PQ at B, the reflected ray moves along the path BC and strikes the mirror RS at C and again reflects back along CD. Prove that  $AB \parallel CD$ .

**Answer:**

Given:  $PQ \parallel RS$

To prove:  $AB \parallel CD$

When two parallel lines are cut by a transversal, alternate angle formed are equal.

In optics the angle of incidence (the angle which an incident ray makes perpendicular to the surface at the point of incidence) and the angle of reflection (the angle formed by the reflected ray perpendicular to the surface at the point of incidence) are equal.

Draw perpendicular lines BL and CM at the point of incidence on both mirrors. Since PQ and RS are parallel to each other, perpendiculars drawn are also parallel i.e, BL || CM.

Since BC is a transversal to lines BL and CM, alternate interior angles are equal.

Hence,  $\angle LBC = \angle BCM = x$  (say).... (1)

By laws of reflection, at the first point of incidence B on mirror PQ, we get,

$$\angle ABL = \angle LBC = x$$

$$\therefore \angle ABC = \angle ABL + \angle LBC$$

$$= x + x$$

$$\therefore \angle ABC = 2x \dots (2)$$

By laws of reflection, at the second point of incidence C on mirror RS, we get,

$$\angle MCD = \angle BCM = x$$

$$\therefore \angle BCD = \angle BCM + \angle MCD$$

$$= x + x$$

$$\angle BCD = 2x \dots (3)$$

From equations (2) and (3), we get  $\angle ABC = \angle BCD$  which are alternate interior angles for the lines AB and CD and BC as the transversal.

We know that, if a transversal intersects two lines such that a pair of alternate interior angles are equal, then the two lines are parallel.

Since. alternate interior angles are equal, we can say AB || CD.

### Exercise 6.3

**Q1. In Fig. 6.39, sides QP and RQ of  $\Delta PQR$  are produced to points S and T respectively. If  $\angle SPR = 135^\circ$  and  $\angle PQT = 110^\circ$ , find  $\angle PRQ$ .**

**Answer:**

Given:  $\angle SPR = 135^\circ$  and  $\angle PQT = 110^\circ$

To find:  $\angle PRQ$

We know that if non-common arms of two adjacent angles form a line, then these angles are called linear pair angle and their sum is equal to  $180^\circ$ .

If the sum of two adjacent angles is  $180^\circ$  then the two non-common arms of the angles form a line.

According to the Angle sum property of a triangle, the sum of the interior angles of a triangle is  $180^\circ$ .

$$\angle SPR + \angle QPR = 180^\circ \text{ [Linear pair]}$$

$$135^\circ + \angle QPR = 180^\circ$$

$$\angle QPR = 180^\circ - 135^\circ$$

$$\angle QPR = 45^\circ \dots (i)$$

$$\angle PQT + \angle PQR = 180^\circ \text{ [Linear pair]}$$

$$110^\circ + \angle PQR = 180^\circ$$

$$\angle PQR = 180^\circ - 110^\circ$$

$$\angle PQR = 70^\circ \dots (ii)$$

Now,

$$\angle PQR + \angle QPR + \angle PRQ = 180^\circ \text{ [Angle sum property of a triangle]}$$

$$70^\circ + 45^\circ + \angle PRQ = 180^\circ \text{ [from (i) and (ii)]}$$

$$\angle PRQ = 180^\circ - 115^\circ$$

$$\angle PRQ = 65^\circ$$

**Q2. In Fig. 6.40,  $\angle X = 62^\circ$ ,  $\angle XYZ = 54^\circ$ . If YO and ZO are the bisectors of  $\angle XYZ$  and  $\angle XZY$ , respectively of  $\Delta XYZ$ , find  $\angle OZY$  and  $\angle YOZ$ .**

**Answer:**

Given:  $\angle X = 62^\circ$ ,  $\angle XYZ = 54^\circ$ , and YO and ZO are the bisectors of  $\angle XYZ$  and  $\angle XZY$  respectively.

To find:  $\angle OZY$  and  $\angle YOZ$

According to the angle sum property of a triangle, sum of the interior angles of a triangle is  $180^\circ$ .

Consider  $\Delta XYZ$

$$\angle X + \angle XYZ + \angle Z = 180^\circ \text{ [Angle sum property of a triangle]}$$

$$62^\circ + 54^\circ + \angle Z = 180^\circ$$

$$\angle Z = 180^\circ - 116^\circ$$

$$\angle Z = 64^\circ$$

Now, OZ is the angle bisector of  $\angle XZY$

$$\text{Thus, } \angle OZY = (1/2) \text{ of } \angle XZY = 1/2 \times 64^\circ = 32^\circ \text{ .....(i)}$$

Similarly, OY is the angle bisector of  $\angle XYZ$

$$\text{Thus, } \angle OYZ = (1/2) \text{ of } \angle XYZ = 1/2 \times 54^\circ = 27^\circ \text{ ..... (ii)}$$

Now, in  $\triangle OYZ$

$$\angle OYZ + \angle OZY + \angle YOZ = 180^\circ \text{ [Angle sum property of a triangle]}$$

$$27^\circ + 32^\circ + \angle YOZ = 180^\circ \text{ [from (i) and (ii)]}$$

$$\angle YOZ = 180^\circ - 59^\circ$$

$$\angle YOZ = 121^\circ$$

Hence,  $\angle OZY = 32^\circ$  and  $\angle YOZ = 121^\circ$

**Q3. In Fig. 6.41, if  $AB \parallel DE$ ,  $\angle BAC = 35^\circ$  and  $\angle CDE = 53^\circ$ , find  $\angle DCE$ .**

**Answer:**

Given:  $AB \parallel DE$ ,  $\angle BAC = 35^\circ$  and  $\angle CDE = 53^\circ$

To find:  $\angle DCE$

We know that when two parallel lines are cut by a transversal, alternate interior angles formed are equal.

According to angle sum property of a triangle, sum of the interior angles of a triangle is  $180^\circ$ .

Since,  $AB \parallel DE$  and  $AE$  is the transversal,

$$\angle DEC = \angle BAC \text{ [Alternate interior angles]}$$

$$\text{Thus, } \angle DEC = 35^\circ$$

Now, in  $\triangle CDE$

$$\angle CDE + \angle DEC + \angle DCE = 180^\circ \text{ [Angle sum property of a triangle]}$$

$$53^\circ + 35^\circ + \angle DCE = 180^\circ$$

$$\angle DCE = 180^\circ - 88^\circ$$

Thus, we have  $\angle DCE = 92^\circ$ .

**Q4.** In Fig. 6.42, if lines  $PQ$  and  $RS$  intersect at point  $T$ , such that  $\angle PRT = 40^\circ$ ,  $\angle RPT = 95^\circ$  and  $\angle TSQ = 75^\circ$ , find  $\angle SQT$ .

**Answer:**

Given:  $\angle PRT = 40^\circ$ ,  $\angle RPT = 95^\circ$  and  $\angle TSQ = 75^\circ$

To find:  $\angle SQT$

We know that when two lines intersect each other at a point then there are two pairs of vertically opposite angles formed that are equal.

According to the angle sum property of a triangle, sum of the interior angles of a triangle is  $360^\circ$ .

In  $\triangle PRT$ ,

$$\angle PTR + \angle PRT + \angle RPT = 180^\circ \text{ [Angle sum property of a triangle]}$$

$$\angle PTR + 40^\circ + 95^\circ = 180^\circ$$

$$\angle PTR = 180^\circ - 135^\circ$$

$$\angle PTR = 45^\circ$$

Now,

$$\angle QTS = \angle PTR \text{ [Vertically opposite angles]}$$

$$\angle QTS = 45^\circ \dots\dots (i)$$

In  $\triangle TSQ$ ,

$$\angle QTS + \angle TSQ + \angle SQT = 180^\circ \text{ [Angle sum property of a triangle]}$$

$$45^\circ + 75^\circ + \angle SQT = 180^\circ \text{ [From (i)]}$$

$$\angle SQT = 180^\circ - 120^\circ$$

$$\angle SQT = 60^\circ$$

Hence,  $\angle SQT = 60^\circ$

5. In Fig. 6.43, if  $PQ \perp PS$ ,  $PQ \parallel SR$ ,  $\angle SQR = 28^\circ$  and  $\angle QRT = 65^\circ$ , then find the values of  $x$  and  $y$ .

**Answer:**

Given:  $PQ \perp PS$ ,  $PQ \parallel SR$ ,  $\angle SQR = 28^\circ$  and  $\angle QRT = 65^\circ$

To find:  $x$  and  $y$

We know when two parallel lines are cut by a transversal, alternate interior angles formed are equal.

According to the angle sum property of a triangle, sum of the interior angles of a triangle is  $360^\circ$ .

Since,  $PQ \parallel SR$  and  $QR$  is the transversal,

$$\angle PQR = \angle QRT \text{ [Alternate interior angles]}$$

$$\angle PQS + \angle SQR = \angle QRT \text{ [From figure]}$$

$$x + 28^\circ = 65^\circ$$

$$x = 65^\circ - 28^\circ$$

$$x = 37^\circ$$

Now, in  $\triangle PQS$

$$\angle PQS + \angle PSQ + \angle QPS = 180^\circ \text{ [Angle sum property of a triangle]}$$

$$37^\circ + y + 90^\circ = 180^\circ \text{ [Since, } \angle QPS = 90^\circ \text{]}$$

$$y = 180^\circ - 127^\circ$$

$$y = 53^\circ$$

Hence,  $x = 37^\circ$  and  $y = 53^\circ$

**6. In Fig. 6.44, the side  $QR$  of  $\triangle PQR$  is produced to a point  $S$ . If the bisectors of  $\angle PQR$  and  $\angle PRS$  meet at point  $T$ , then prove that  $\angle QTR = \frac{1}{2} \angle QPR$ .**

**Answer:**

Given:  $TQ$  and  $TR$  are the bisectors of  $\angle PQR$  and  $\angle PRS$  respectively

To Prove:  $\angle QTR = \frac{1}{2} \angle QPR$

According to the exterior angle theorem of a triangle, if a side of a triangle is produced, then the exterior angle so formed is equal to the sum of the two interior opposite angles.

$$\angle PRS = 2\angle TRS \dots\dots(i) \text{ [Since TR is the angle bisector of } \angle PRS \text{]}$$

$$\angle PQR = 2\angle TQR \dots\dots(ii) \text{ [Since TQ is the angle bisector of } \angle PQR \text{]}$$

Now, in  $\triangle TQR$

$$\angle TRS = \angle TQR + \angle QTR \text{ [Exterior angle theorem of a triangle]}$$

$$\angle QTR = \angle TRS - \angle TQR \dots\dots\dots (iii)$$

Similarly, in  $\triangle PQR$

$$\angle PRS = \angle QPR + \angle PQR \text{ [Exterior angle theorem of a triangle]}$$

$$2\angle TRS = \angle QPR + 2\angle TQR \text{ [From (i) and (ii)]}$$

$$\angle QPR = 2\angle TRS - 2\angle TQR$$

$$\angle QPR = 2(\angle TRS - \angle TQR)$$

$$\angle QPR = 2\angle QTR \text{ [From (iii)]}$$

$$\angle QTR = 1/2 \angle QPR$$

Hence proved,  $\angle QTR = 1/2 \angle QPR$ .
